

## JUST INTONATION

This is a script to facilitate the creation of Just Intonation scales. It requires the full version of Kontakt 6.2.0 or later. It assumes octave equivalence and a scale of 12 pitches.

For each key class you can define an interval as a fraction, typically the Root key is set to 1/1, but this is not required by the script.

You can shift the Root key with the knob and keep the interval relationships constant.

If no other scripts are running in your instrument, you will hear your tuning and can make adjustments as necessary. If other scripts are present however, it's not possible to guarantee you will hear the results of the script. For example, most legato scripts do not account for microtuning and will overwrite any tunings you create here.

There is an Options menu with two commands: Initialise the tuning (to a 7-limit chromatic scale), and Export the Tuning. The format of the exported tuning is the same as that you can Import/Export from many other Soniccouture instruments that support microtuning.

## LOADING SCRIPTS INTO KONTAKT

You will need a full version of Kontakt to load scripts, you cannot load scripts in Kontakt Player.

Copy the script file (.nkp) to:

user / Documents / Native Instruments / Kontakt / Presets / Scripts /  
... and restart Kontakt.

Open a Kontakt Instrument in Edit mode, and enable the script editor. Choose a script slot and from the Preset menu on the left you will find your script in the User drop down:

If you save an instrument with a script in place, then it will load automatically next time.
